

Medical perspective.

Australian abandoned the established international protocol for a response to a pandemic, and implemented lockdowns etc.

Anti-virals like Ivermectin and Hydroxychloroquine are Zinc ionophores, and they are some of the safest drugs in medicine. But they were generally banned for treating Covid19 except in hospital trials. The initial reason for this was that they were not safe, but it was later confirmed that the real reason was that the TGA and AHPRA were concerned that they might have created vaccine hesitancy. However when the anti-virals from Big-Pharma became available it was no time before they were allowed to be prescribed here.

Doctors in Queensland could be jailed for prescribing hydroxychloroquine for Covid 19. Laws were passed in Qld that made it illegal to spread "disinformation" (that is, information not consistent with the governments narrative) was introduced late in the pandemic.

The TGA should never have approved any vaccines because there were, early on in the pandemic, protocols that used safe anti-virals, hydroxychloroquine and Ivermectin.

The public were told that the vaccines were tested for their ability to stop transmission when they were not. We were told that they were safe, but the original data was only released after court proceedings in the USA. Their safety remains an issue.

The TGA approved two vaccines, one from China and one from India, which were among the vaccines people from overseas could take for entry into Australia. These two vaccines did not use cell lines from [REDACTED] in their testing or production. While [REDACTED] did not use these cell lines in their production they used those cell lines in their testing. Why weren't these ethical vaccines from India or China made available in Australia?

[REDACTED] vaccine for Covid 19 was developed in Adelaide . It was also an ethical vaccine that did not use [REDACTED] from voluntary [REDACTED]. I was a protein based vaccine that is using vaccine technology like Novavax - it was approved for EUA before Novavax (in Iran). Its ongoing development was not supported by the government or the CSL and no reason was given for this. Why didn't the Government support this Australian developed vaccine?

The Australian government has refused to have a royal commission into the Covid19 pandemic in Australia. Why? There seems more than enough to investigate simply from a medical perspective.
