

COVID Submission: Government Failure and Betrayal

Introduction:

The Australian federal government's response to the COVID-19 pandemic has not only been inadequate but has also led to severe consequences, including the unnecessary loss of thousands of lives. The government's mismanagement, declaration of a pandemic when there wasn't one, banning of effective therapeutics, inappropriate use of diagnostic tests, and the censorship of doctors have all contributed to this devastating outcome. This submission aims to shed light on these failures and the dire consequences they have had on the Australian population.

1. The Pandemic Controversy:

The true rate of death from COVID-19 remains uncertain, as there are conflicting reports and suspicions of misattributed deaths. It is essential to ascertain the accurate mortality rate to better comprehend the magnitude of the threat posed by the virus and implement appropriate measures accordingly. Moreover, it is crucial to investigate whether the high mortality rate during the pandemic was a result of hospital failures or the use of ineffective treatments such as Remdesivir. Scrutinizing these factors will help determine the culpability of the authorities in the loss of lives.

Additionally, the question of virus isolation arises. It is imperative to identify those accountable for the task of isolating the virus and whether any conflicts of interest existed within the process. This includes examining the appropriate use and accuracy of diagnostic tests such as PCR and RAT tests.¹ The misuse or flawed implementation of these tests can lead to inaccurate case numbers, misdiagnoses, and distorted perceptions of the pandemic's severity. Investigating the appropriateness and reliability of these tests will provide valuable insights into the government's handling of the pandemic.

2. Treatable Disease with Safe Therapeutics:

The decision to ban effective therapeutics like Ivermectin² and Hydroxychloroquine³ raises serious concerns. There is an overwhelming amount of evidence supporting the effectiveness of these drugs

² <https://c19ivm.org/meta.html>

in treating COVID-19. Yet, the Australian government chose to disregard this evidence, denying patients potential life-saving treatments. Additionally, the discouragement of essential supplements like Vitamin D, Zinc, and Vitamin C by the National Taskforce raises further questions about their intentions and the scientific basis of their recommendations. Were these decisions influenced by external interests? Were there experts with diverse perspectives involved in devising these guidelines?

Furthermore, the use of Remdesivir as a treatment option must be carefully examined.⁴ Multiple studies have shown that Remdesivir may cause renal failure and can potentially lead to deaths. If patients died as a result of Remdesivir treatment, it is crucial to quantify and acknowledge the number of fatalities caused by this drug. Failure to do so would indicate a lack of accountability on the part of the authorities and a disregard for patient safety.

3. Vaccine Promotion and Lack of Long-Term Safety Data:

The government's relentless push for vaccines as the only viable solution is concerning, particularly considering the limited availability of long-term safety data. While acknowledging the importance of vaccination in combating the spread of COVID-19, it is essential to consider the potential risks and ensure transparency regarding vaccine safety. Neglecting to address public concerns about vaccine side effects and dismissing alternative treatment options unnecessarily limits individuals' freedom of choice in managing their health.

4. AHPRA's Targeting of Doctors:

The suspension and targeting of doctors, such as those using Ivermectin off-label, is deeply troubling. Off-label use of medications, including Ivermectin, is a legitimate medical practice. Punishing doctors for prescribing drugs with a potential to save lives undermines medical autonomy and stifles innovation in treatments. A thorough investigation is required to evaluate the actions of AHPRA and to ensure that doctors can provide the best possible care to their patients without fear of retribution.

Conclusion:

The Australian federal government's mismanagement of the COVID-19 pandemic has had devastating consequences for the public. The failure to accurately assess the pandemic's severity, the banning of effective therapeutics, the inappropriate use of diagnostic tests, the exclusive focus on vaccines as the only solution, and the targeting of doctors using off-label treatments have all led to unnecessary deaths and suffering. It is clear that the government's approach to the pandemic is

⁴ <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7907730/>

deeply concerning, and there is a need for another inquiry to uncover the truth and hold those responsible accountable. The Australian people deserve to know the truth and to understand the reasons behind the government's actions. People need to be held accountable for the unnecessary loss of lives. A thorough investigation is necessary to prevent such failures in the future, prioritize scientific evidence, promote transparency, and restore public trust in the government's response to health crises.
