

## **Concerns Regarding the COVID-19 Response in Australia**

I hope this letter finds you well. I am writing to express my comprehensive concerns regarding various aspects of the COVID-19 response in Australia. While acknowledging the complexities involved in managing a global pandemic, I believe it is essential to address certain issues that have arisen during the course of these efforts.

As a fit and active young professional, I felt the profound impact of the stringent measures imposed by State Governments. Travel restrictions and the absence of a vaccine passport limited my ability to stay or dine in certain places for work. The persistent uncertainty surrounding major life events, such as attending my best friend's wedding, coupled with the fear of potential job loss, added a layer of stress that lingered for many months. Confronted with uncertainties and concerns regarding the risks associated with mRNA vaccinations, I made a personal decision to refrain from getting vaccinated. I remained open to receiving a protein-based vaccine, such as Covax-19, which was in development in Adelaide. As subsequent mRNA vaccine booster shots were introduced, my conviction in maintaining this choice only strengthened.

Hearing stories from friends who ended up in the hospital or suffered adverse effects from the mRNA vaccinations, rather than from COVID itself, prompted me to question the narrative. The disparity in government payouts, where some individuals received more from these benefits than from their regular employment, the use of face masks, and PCR tests raised significant concerns for me.

The prevailing atmosphere seemed characterised by panic rather than common sense. The health measures felt dogmatic, and the advertisement was reminiscent of propaganda posters from World War II urging enlistment. Unfortunately, scientific discourse and rational conversations appeared to be conspicuously absent from the narrative. Sadly, the alternative views that did make it into the public light were derogatorily dismissed or grouped as conspiracy theory.

### **Concerns**

#### **Overuse of Lockdowns and Economic Impact:**

The prolonged use of lockdowns has had a detrimental impact on the Australian economy, particularly affecting businesses forced to close. Striking a balance between public health and economic stability is crucial for the nation's overall well-being.

#### **Abuse of Government Payments:**

Reports of the misuse of government payments highlight the need for stringent measures to ensure financial assistance reaches those in genuine need and prevents unnecessary costs to the country.

#### **Pressures on Vaccination:**

The pressure exerted by media, local government, and employers on individuals to receive the COVID-19 vaccine has raised concerns. Respect for individual choices is vital for fostering a cooperative and informed public response.

#### **Communication on Vaccine Injuries:**

Transparent communication regarding vaccine injuries is essential for building public trust. Addressing concerns and providing adequate information will contribute to a more informed and cooperative public response.

**Fair Opportunities for Local Vaccine Providers:**

Ensuring fair opportunities for local vaccine providers is crucial for an inclusive and efficient vaccination distribution process, promoting competition and contributing to the overall healthcare effort.

**Medical Approaches Beyond Vaccination:**

The exclusive focus on vaccination, to the detriment of exploring other medical approaches such as ivermectin and hydroxychloroquine, is disappointing. Recognising the known risks of these medications compared to a new vaccine is essential for a comprehensive understanding of potential treatment options for COVID-19.

**Use of Face Masks:**

The promotion and enforcement of face masks, despite evidence of their limited effectiveness in preventing transmission, have raised concerns. The negative impact on the emotional well-being and development of both children and adults, coupled with the adverse environmental effects of disposable masks, necessitates a reevaluation of the widespread use of face masks. The environmental impact, including increased waste and pollution from discarded masks, underscores the importance of considering alternative measures that balance public health and environmental sustainability.

**PCR Test Limitations:**

It is important to recognise the limitations of the PCR test, which was not originally designed to diagnose COVID-19 or any virus. The test does not inherently indicate an individual's sickness.

**Vaccine Passports and Travel Restrictions:**

The implementation of vaccine passports preventing non-vaccinated individuals from travelling raises concerns. Since the primary purpose of vaccination is to prevent individuals from contracting COVID-19, restricting the travel of non-vaccinated individuals seems contradictory and warrants a reevaluation of these measures.

**Solutions**

**Avoid Imposing Lockdowns:** Adopt a targeted approach to restrictions based on specific risk factors, avoiding blanket lockdowns that negatively impact the economy.

**Reevaluate Additional Payments:** Scrutinise and revise the criteria for government payments to ensure judicious allocation, preventing misuse and unnecessary financial burden.

**Oppose Vaccine Mandates:** Avoid implementing mandates for COVID-19 vaccination, respecting individual autonomy and choices.

**Empower Doctors to Exercise Professional Judgement:** Allow healthcare professionals the freedom to explore and apply known drugs, like ivermectin and hydroxychloroquine, in their treatment plans, enabling them to assess the risk-benefit ratio independently.

**Prevent Discrimination Based on Vaccination Status:** Establish policies that do not discriminate between individuals based on their vaccination status, fostering inclusivity and respect for personal choices.

**Promote Individual Responsibility:** Encourage individuals to stay home when feeling unwell and practice self-isolation as responsible measures to prevent the spread of illnesses.

**Discourage Widespread Use of Face Masks:** Reevaluate the widespread use of face masks, considering evidence on their efficacy, and discourage their use unless in specific high-risk situations.

**Minimise Reliance on PCR Testing:** Reduce reliance on PCR testing as the sole determinant for COVID test (or other viruses), recognising its limitations and exploring alternative testing methods.

**Prioritise Local Vaccine Manufacturers:** Give preference to local vaccine manufacturers to support domestic industries and enhance the efficiency and inclusivity of the vaccination distribution process.

These solutions aim to strike a balance between public health concerns and individual freedoms, fostering a more nuanced and practical approach to addressing the challenges posed by the ongoing pandemic.

In conclusion, I appreciate the government's dedication to managing the COVID-19 crisis. However, addressing these comprehensive concerns will contribute to a more balanced, effective, and science-driven response that considers multiple medical approaches and respects individual choices.

Thank you for your attention to these matters, and I trust that the ongoing response efforts will incorporate these considerations for the benefit of the Australian people.
