- My spouse and I never caught Covid-19 even though both of us did not take any C19 vaccines and we had travelled overseas earlier this year. Both of us are in our 70s.
- The Covid-19 vaccines do not stop infections nor transmissions, why were they mandated?
- There were no long-term studies available prior to the mandates so even experts do not know the extent of the adverse effects that they might cause. How could they be mandated?
- Adverse effects caused by the Covid-19 vaccines suffered by people we personally know include myocarditis and pericarditis.
- We do not need young people to take Covid-19 vaccines to protect us while they take on unknown risks themselves.
